

BEVOX HELI-BEVEL GEARBOXES

rotomotive

looks good. performs better.

Our Manufacturing facility in India

Rotomotive Powerdrives India Ltd is an Italian joint venture company operating in India since 2006. It has access to European technology and know-how from Motive srl, one of the joint venture partners and sources parts and components from Indian suppliers. We have a modern manufacturing facility in Gujarat, India. Rotomotive has the capacity to design, prototype and manufacture custom motors for various applications.

Our modern manufacturing plant has advanced machinery for automatic winding, trickle and vacuum pressure impregnation, precise balancing, conveyorized assembly, enclosed painting lines, automatic testing facilities with all components bar coded for traceability, consistent quality and low production time.

We also have an advanced testing facility for type testing motors and gearboxes which enables us to plot accurate speed torque curves and carry out temperature rise tests and other type tests as per IEC 60034/IS: 12615.

A

B

C

D

Uniquely contoured, rigid, precise housing in die cast aluminium.

Housing shape has been optimized to maximize the draining of water or liquid in the event of the gearbox being subjected to splashing or washing

A modular design with detachable output flange and intergral feet permits the easy and fast conversion between flange and foot mounting.

2 safety plastic covers on the output are always provided to protect Bevox during transportation and storage and then the user from accidental contacts with moving parts.

Hypoid gear in the first stage (2 stage gearbox) and in the middle stage (3 stage gearbox), more silent.

TECHNICAL CHARACTERISTICS

Use of high strength steels like 20CrMnTi and case hardening to 60 ± 2 HRC reduce the wear rate in wheels. All wheels are profiles ground to DIN 3962 class 6 accuracy for low noise and high efficiency.

5 interchangeable plugs, including one breather plug and a level plug. Please note that the vent plug also allows you to reduce the internal pressure on seals, and thus increases the efficiency of the gearbox.

The surface is exposed to a bombardment of micro-spheres that induces compression and increases further the fatigue resistance.

+mechanical parts locked in their positions by snap rings and spacers. This also ensures better absorption of axial thrust and prolongs the life of bearings.

Mating surfaces are machined for perfect perpendicularity.

Shafts are made from high strength alloy steel.

IEC flange and hollow shaft. Choice of hollow input flanges permits direct mounting of any standard motor.

Unique construction of Bevox makes it possible to mount any size in any position.
This flexibility is achieved by:
+ZZ prelubricated bearings on input and output shaft

Rated output torque M_{n2} (Nm)

Torque output transmissible under uniform loading and referred to the input speed n_1 and the corresponding output speed n_2 . The output torque can be calculated with the following formula:

$$M_{n2} = \frac{P_{n1} [\text{kW}] \cdot 9550}{n_2} \cdot \eta$$

Torque demand M_{r2} (Nm)

Torque calculated based on application requirements. It must be $< M_{n2}$ of the chosen Bevox unit.

Input power P_{n1} (kW)

This is the power value of the motor applied to the input shaft and corresponding to a certain input speed n_1 , a service factor $f_s = 1$ and a duty service S_1 . It is even possible to calculate the motor size necessary by using the formula:

$$P_{n1} [\text{kW}] = \frac{M_{r2} \cdot n_2}{9550 \cdot \eta}$$

Since the value calculated in this way could not really correspond to an input power actually available in the IEC standardised motors, it will be necessary to choose, among the input powers available, the one which is immediately higher, checking this in the Rotomotive catalogue of the motors.

Efficiency η (%)

An inherent factor in the selection helical gear boxes is the efficiency η , defined as the ratio between the mechanical power coming out from the output shaft, and the power in the input shaft:

$$\eta = \frac{P_{n2}}{P_{n1}}$$

The efficiency in helical gearboxes is mainly determined by the gearing and

bearing friction.

The efficiency of Bevox varies with the nr of stage: It's 90% when the reduction stages are 3, 92% when the stages are 2. The starting efficiency is always less than the efficiency at rated speed.

Gear ratio i

It is the relationship of the input speed n_1 and the output speed n_2

$$i = \frac{n_1}{n_2}$$

In the combined, the total ratio is the result of the product of the ratio of the two single gearboxes.

Input speed n_1 (rpm)

It is the speed the Bevox unit is driven at.

Output speed n_2 (rpm)

It is the rotation speed of the output shaft.

Service factor f_s

It is a numeric value describing the Bevox unit service duty. With unavoidable approximation, it takes into consideration:

- The daily working hours h/d
- The load classification (see table 2), and then the moment of inertia of the driven masses.
- The number of starts per hour s/h
- The presence of brake motors, for which it is necessary to multiply for 1.12 the service factor value deducted by the graph 2.
- The significance of the application in terms of safety, for example lifting of parts.

In the graph 2, the service factor f_{sr} required by a certain application can be attained, after having selected the proper "daily working hours" (h/d) column, by intersecting the number of starts per hour (s/h) and one of the a, b or c curves. The curves a, b and c are linked with the load classification described in the table 2.

tab. 2

load Classification	Application
c uneven operation, heavy loads, larger masses to be accelerated	conveyors with violent jerks; compressors ad alternate pumps with 1 or more cylinders; machinery for bricks, tiles and clay; kneaders; milling machines; lifting winches with buckets; rotting furnaces; heavy fans or mining purposes; mixers for heavy materials; machine-tools; planing kinds; alternating saws; shears; tumbling barrels; vibrators; shredders; turntables
b starting with moderate loads, uneven operating conditions, medium size masses to be accelerated	belt conveyors with varied load with transfer of bridge trucks for light duty; levelling machines; shakers and mixed for liquid with variable density and viscosity; machines for the food industry (kneading troughs, mincing machines, slicing machines, etc); sifting machines for sand gravel; textile industry machines; cranes, hoists, goodstifts; fertilizer scrapers; concrete mixers; folding machines; winches; crane mechanisms
a easy starting, smooth operation, small masses be accelerated	belt conveyors for light material; centrifugal pumps; rotary gear pumps; screw feeders for light materials; lifts; bottling machines; auxiliary controls of tool machines; fans; power generators; fillers; small mixers

If, after the selection of the right M_{r2} and n_2 in the following performance tables, you don't find a Bevox unit whose service factor f_s is $>$ of the requested one f_{sr} , you can choose a Bevox unit in which $M_{n2} > M_{r2}$.

In fact, in order to satisfy f_{sr} , you can choose another Bevox unit whose output torque is $> M_{c2}$ output torque, where:

$$M_{c2} = M_{r2} \cdot f_{sr}$$

Note: This rule is valid only if the new Bevox unit that has been selected in this way has a service factor $f_s > 1$ in the performance tables.

From another point of view, the value of f_s in the performance tables refers to a case

in which the effective torque requested by the application M_{r2} matches perfectly with the one appearing on the catalogue M_{n2} . Whenever the torque indicated in the performance table is higher than the requested one, the offered service factor of the performance table can be increased according to the formula:

$$f_s \text{ real} = \frac{f_s \text{ on the table} \cdot M_{n2} \text{ on the table}}{M_{r2}}$$

The value of f_s calculated in this way must be $\geq f_{sr}$.

LUBRICATION & MOUNTING POSITION

Each BEVOX is supplied with long-life synthetic oil and do not require any maintenance.

BEVOX	Oil (lt.)						ISO	Temp.	Oil Type
	B3	B6	B7	B8	V5	V6			
V0502	0.22	0.20	0.13	0.15	0.25	0.14	Vg320	-5 °C to +50 °C	Shell Tivela: S320 Klubersynth: GH6-320

V0903	0.15	0.11	0.11	0.11	0.17	0.20			

V050-2 means Bevox050 in 2 stages & V050-3 means Bevox050 in 3 stages. In case of 3 stage gearboxes, input cover (part no. 4, refer page 12) to be filled with quantity mentioned in table. Bevox is supplied with oil filled from factory but in case of maintenance at sight / service center, input cover to be filled separately.

After adapting the oil quantity, each BEVOX can be mounted in ANY position, thus giving big advantages in the inventory reduction and interchangeability due to the following 3 characteristics:

In smaller ratios there may be some seepage of oil from the breather plug at certain speed due to churning action of gears. In such cases spring loaded breather plug or breather plug with extended pipe or solid plug may be used. For some applications, breather plug may be must in spite of possibility of oil leakage. For such case please contact Rotomotive.

ZZ shielded pre lubricated bearings on input and output shaft

5 interchangeable plugs, including one breather plug and a level plug. Level and breather plug must be positioned according to this chart

Mechanical parts locked in their positions by circlips and spacers. This also ensures better absorption of axial thrust and prolongs the life of bearings.

B5, V1 & V3 positions are for flange mounted

Note : Efficiency is computed considering the frictional losses of output seals, bearing frictional losses and lubrication losses. Torque increases by 3% in 2 stage gearboxes and 5% in 3 stage gearboxes if these losses are not considered
